Parsing Query Parameters

Description: Write a Python program that sends a GET request to
jsonplaceholder.typicode.com/comments with a query parameter
postId=1 and prints the number of comments for that post. Use the
socket module to connect to the server.

Input: None.

Output (without unit test): The number of comments for the post with
postId=1.

Output (with unit test):

connect called with: call(('jsonplaceholder.typicode.com', 80))
send called with: call(b'GET /comments?postId=1 HTTP/1.1\r\nHost:
jsonplaceholder.typicode.com\r\nConnection: close\r\n\r\n')
recv called with: call(4096)
test attribute passed: 1 is equal to 1
